

Zero structural Timber used in construction

Zero timber is used in the structure of the Atomix hull & decks, cutting edge technology such as closed cell foam – honeycombed core – unique non-perishable laminate strengthening and rigidity systems are all employed.

This rainforest friendly policy also ensures that the age old problems associated with the use of timber such as:

- Twisting and warping timber beams (stringers) causing uneven hull surfaces & gelcoat cracks
- Creaking floors and decks caused from delaminating fibreglass to timber
- Expensive repairs caused by Wood rot from water contamination

Are all eliminated from an Atomix Boat
